Social Science Computation and Data Science

POLS 6394 | Fall 2026 University of Houston

Instructor: Boris Shor **Email:** bshor@uh.edu **Website:** https://bshor.github.io/ **Office:** PGH 396 **Office Hours:** By appointment via Calendly **Teaching Assistant:** Amanda Austin (in class at every meeting)

Class Meeting: Tuesday/Thursday 1:00–2:20 PM **Location:** PGH 310 **Required:** A laptop, brought to every class meeting

---

Course Description

This course teaches the practical side of working with data and computing resources — the craft that surrounds statistics but is rarely taught alongside it. Our methods sequence teaches you the minimum R needed to estimate models; this course teaches everything around that: writing real programs, managing and acquiring data, producing publication-quality documents and websites, collaborating and version-controlling your work, and using modern AI tools productively and critically. These are the skills academics otherwise pick up slowly, badly, or never — and for students headed to non-academic careers, they are concrete, marketable skills that belong on a CV.

The semester has two parts. In **Part I (through the October 27 midterm), AI tools are strictly prohibited.** You'll learn to do the work by hand: the tidyverse, programming, version control, text as data, and APIs, ending with a dashboard. In **Part II (beginning right after the midterm on October 27), AI tools are required.** You'll use chat assistants, IDE copilots, and programmatic LLM access, with three sessions centered on **agentic coding through Codex**. You'll use it on real work, including your own final project. You'll also use LLMs as research instruments, including live demonstrations of synthetic survey respondents from my forthcoming Cambridge book on LLMs for public opinion research.

Here's why: you cannot supervise a tool you cannot understand at a deep level. AI coding tools are enormously productive for someone who can read code, debug it, and recognize wrong output. For someone who can't do those things yet, they're risky because the errors look just like the successes. Part I gives you the skills you need for Part II.

R is the course's primary programming language. We also work directly with Quarto, git, GitHub, and YAML. We start on Posit Cloud, so there's nothing to install on day one.

Instructional Approach

This is a hands-on skills course, not a discussion seminar and not a lecture course. Each 80-minute class mixes guided instruction with lab time — roughly half and half — and you'll write code in every single class meeting. We work in shared Quarto documents with deliberate blank space: I demonstrate, then you fill in the gaps while Amanda and I circulate. The first session of each instructional pair introduces new material; the second extends it and is more lab-heavy. There is no class on September 3.

Bring your laptop to every class. You can't pass this course without attending it: a large share of your grade is earned by work committed and pushed during class time.

Learning Objectives

By the end of the semester, students will be able to:

- Organize a research project as a reproducible pipeline in R and Quarto, from raw data to a rendered paper, presentation, and website
- Use git and GitHub fluently for version control, collaboration, and reproducible research
- Write real programs in R using functions, iteration, vectorization, and error handling
- Wrangle, join, reshape, and visualize data with the tidyverse at a professional level
- Acquire data through web APIs — authentication, rate limits, JSON, and the political science API landscape — and supervise AI-written code that reads other public sources, such as shared spreadsheets
- Treat text as data: count words, build keyword dictionaries, and fit a simple topic model, then compare those measures with LLM annotation in Part II
- Build a simple Quarto dashboard and share work through GitHub Pages or Posit Connect Cloud
- Work with an agentic coding tool (Codex) on a real research project: scoping tasks, steering with project conventions, reviewing agent-written code, and verifying results

- Write a full academic paper in Quarto — sections, cross-references, and a managed BibTeX bibliography (JabRef + Google Scholar) — rendered to journal-ready formats
- Use AI tools — chat, copilots, and programmatic LLM APIs — productively, verifiably, and critically, including as research instruments for measurement and annotation
- Articulate where AI assistance helps, where it fails, and how to verify its output

---

Course Requirements

Component	Weight
In-class lab work (committed and pushed before leaving class)	10%
Take-home problem sets (6 graded, submitted via GitHub)	25%
Part I midterm practical (in class, October 27 — AI off)	15%
Part II final practical (exam period, December 14 — AI required)	15%
Problem-set walkthroughs	5%
Semester research and portfolio project	30%

Your lowest score is dropped separately in each of these three categories: in-class lab work, take-home problem sets, and problem-set walkthroughs.

No corrections or resubmissions after grading. Feedback explains the assessment and may discuss errors, but it never assigns corrections, revisions, resubmissions, or additional work on a graded submission. You do not need to change a submitted file or reply to feedback to keep your grade. Scheduled stages of the semester project remain separate assignments, not resubmissions of graded work.

In-Class Lab Work (10%)

Before class, you'll receive that session's Quarto workbook. Keep it open for guided notes and follow-along exercises while I teach, then continue in the same file during the lab block and finish with a short learning/error log. Amanda and I will circulate, answer questions, and help you locate problems. Commit and push the workbook before leaving class; that commit records your in-class work even if the lab is unfinished. When a lesson asks you to finish at home, render and push the completed version by 7:00 PM the night before the next class. Guided notes and the closing log are graded for good-faith completion, not correctness; a documented failed attempt is worth full credit, while an empty document is not. Solutions are released after the lesson's completion period.

Take-Home Problem Sets (15%)

Six graded take-home problem sets extend the lab work, and Set 4 is optional, ungraded practice for the midterm. Sets 1–5 are AI-off; Sets 6 and 7 require AI. Each graded set is due at **10:00 AM** on the date below. Commit and push it to your private course repository. The sets are graded for good-faith completion rather than polish; we may begin class by discussing approaches, common errors, or questions from the submitted work.

Set	Released	Due at 10:00 AM	Focus
1	Sep 23	Tue Sep 29	Reshape and validate democracy data
2	Oct 5	Tue Oct 13	Compare fixed and separate panel scales; explain what each figure supports
3	Thu Oct 15	Tue Oct 20	Functions and iteration on text: extract respondents' words from AI-conducted tariff intervi
4	Tue Oct 20	Optional; not graded	Practice midterm: import an unfamiliar dataset, clean it, summarize it, and make one polishe
5	Thu Oct 22	Tue Nov 3	Build your own two-page Quarto dashboard of Congress.gov bills by hand, started in class
6	Tue Nov 10	Tue Nov 17	Last week's votes: AI-written code reads the 2026 election results, compares them with 2024
7	Thu Nov 19	Thu Dec 3	Build your own eval on a task from your research and compare two models

I'll put each prompt in your private repository on its release date. Sets 1–5 must be completed without AI, including Set 5, which is due after Part II begins.

Sets 6 and 7 require AI and are graded on your supervision of the tool rather than the tool's output. **Set 6** is released November 10: Posit Assistant reads the 2026 House results from a public Google Sheet and compares each district with 2024, and you submit the checks plus a critique memo explaining what the AI got wrong, how you caught it, and what you verified by hand. In **Set 7** you **build your own eval**: design 10–20 test prompts with ground truth and a scoring rule on a task from your own research domain, run it with GPT-5.6 Luna and GPT-5.6 Terra, and submit the mini leaderboard plus a memo on what the gap means. An eval is a systematic, quantified test of a model on *your* task.

You can also bookmark the course deadline calendar.

You may discuss a problem with classmates, work alongside one another, compare intermediate results, and help diagnose errors. Each student must write and run their own code, produce their own render, and write their own explanations. Do not exchange completed files or copy a finished pipeline. Include a brief collaboration note with each submission. Amanda and I will not provide help while a problem set is open; we will discuss questions and common problems after the deadline. The walkthroughs draw directly from recent problem sets.

The Part I AI rule applies to Problem Sets 1–5. These sets prepare you for the walkthroughs and midterm; using AI instead of doing the work will leave you unprepared for both.

Part I Midterm Practical (15%)

Class on **Tuesday, October 27** begins with a supervised practical: a realistic task (import a dataset you have not seen, clean it, summarize it, produce one polished figure) done solo, in the room, with AI off. You have **60 minutes, including rendering**; a brief AI-landscape introduction and installation guidance follow. Documentation and your own past work are fair game. Committed, sensible, unfinished work earns most of the credit; time pressure is handled generously.

Part II Final Practical (15%)

During the **exam period (Monday, December 14)**, alongside your final presentation, you sit a supervised practical in which AI use is **required**. You get a task you haven't seen and about 35–40 minutes with your full toolkit — Codex, chat, and the API. Grading is based on whether the result is verified correct and on a short account of what the AI got wrong and how you caught it.

If a UH-recognized excused absence prevents you from taking either practical at the scheduled time, contact me to arrange a rescheduled practical. Labs, problem sets, and walkthroughs are covered by the dropped-score rule rather than individual absence makeups.

Problem-Set Walkthroughs (5%)

About four times during the semester, I will schedule a short conversation with you about a recently submitted problem set. You will have your code, output, and notes open. I will ask you to explain what the task required, walk through one pipeline or choice, interpret the result, and consider a small change to the input. You will not be asked to write code from a blank screen.

The aim is explanation and diagnosis, with no reward for speed. Finding an error while explaining your work and describing how you would correct it demonstrates understanding. I will identify the relevant problem in advance so you can review your submission.

Semester Research and Portfolio Project (30%)

The capstone is **a paper of your own that you work on throughout the semester**. You can use a dissertation prospectus (or a chapter of one), a seminar paper you owe another course, a working paper, an MPP capstone, or whatever else you actually need to write this semester. **You must author it end-to-end with this course's tools.** By December you'll have a reproducible repository, a managed bibliography, the paper rendered to PDF, a revealjs presentation, and a simple Quarto dashboard. **If your project does not naturally support a data pipeline, first figure, or dashboard, propose an alternative computational artifact in your October 1 project plan for instructor approval.**

The package also includes your data-driven CV and academic website, first made functional in Week 7 and then maintained through the semester. The site must render correctly, but public deployment is your choice; posting the rendered CV is also optional. By December the site should present you and the work you would want to make public. You present the

research project during the final exam period. AI tools are permitted from Part II onward, and the repo must include an AI-use statement. **If an LLM measures anything in your paper—annotations, classifications, synthetic responses—your repository must contain the eval that justifies it** (the human-labeled subset, the scoring code, the agreement numbers).

The 30% is divided as follows:

Project component	Weight
Final paper and reproducible repository	18%
On-time, good-faith milestone work	4%
Dashboard or approved alternative computational artifact	3%
Presentation and defense	3%
Updated CV and website	2%

Milestones are progress checks, not polished submissions. The milestone portion is graded for timely, good-faith completion; each checkpoint should show the specified work in the repository even if it still needs revision.

Milestones (each is a commit in your private course repository):

Date	Deliverable
Thu Sep 10 (Week 3)	**Paper project started** with a one-paragraph topic statement (README)
Tue Sep 22 (Week 5)	**Materials in hand**: raw data committed (or documented if unshareable) and the first cleaning script runs; for a data-light project, essential sources or other project materials are acquired and organized
Thu Oct 1, 10:00 AM (Week 6)	**Project plan** (1 page): question, materials, intended analyses, and outputs; request approval here for any alternative to the default pipeline, figure, or dashboard
Tue Oct 6 (Week 7)	**Paper skeleton** renders to PDF with a managed `.bib`, at least three real citations, and a first figure or approved equivalent
Thu Oct 15 (Week 8)	**Professional materials**: CV and minimal website both render; public deployment and a public CV link are optional
Mon Nov 9, 7:00 PM (Week 12)	**First real result** (moved from November 5): one real result from your own project, in a paper that renders end-to-end. A table or figure of your data, a first estimate, coded texts, a replication, or a written section citing your bibliography all count
Thu Nov 19 (Week 13)	**Repository check**: pipeline runs end-to-end from a clean clone and a full draft renders. A good-faith complete attempt may correct reproducibility problems identified by this check through December 1 without penalty.
Mon Dec 14, 2:00–4:00 PM	Exam period: **final practical** (~35–40 min, AI required) + **presentation** (revealjs, from your repo); final paper, repository, dashboard or approved alternative, AI-use statement, and **updated CV + website** due

Materials and Costs

There is no required textbook to purchase. The backbone readings are free, current, and online:

- Jenny Bryan, *Happy Git and GitHub for the useR* — happygitwithr.com
- Chester Ismay, Albert Y. Kim, and Arturo Valdivia, *ModernDive: Statistical Inference via Data Science*, 2nd ed. — moderndive.com/v2
- Kieran Healy, *Data Visualization: A Practical Introduction*, 2nd ed. draft — socviz.co
- Kieran Healy, *The Plain Person's Guide to Plain Text Social Science* — plain-text.co
- Hadley Wickham et al., *R for Data Science*, 2nd ed. — r4ds.hadley.nz (reference)

Recommended for your permanent shelf (not required): Edward Tufte, *The Visual Display of Quantitative Information*.

About readings in this course: this is a skills course, and its readings look like the field's actual conversation — **blog posts and sections of free online books**, plus a small number of journal articles (provided as PDFs). Expect posts by working quantitative social scientists on both sides of the AI-in-research controversy, chapters from the online books above, and classics on replication as the scientific standard. Readings are short, assigned per week, and fair game for discussion.

Required course costs (~$50 total, in place of a textbook):

1. **Two months of ChatGPT Plus (~$20/month, ~$40 total)**, active by October 27 and covering the rest of the semester — this provides **Codex**, the agentic coding tool at the center of Part II (the subscription's agent-usage limits go further than the alternatives), plus the chat interface used throughout Part II and your final project.
2. **~$10 of OpenAI API credit** for the programmatic LLM work (the ellmer/silicon-sampling week and any API use in your final project). GPT-5.6 Luna is the workhorse for routine and batch calls; GPT-5.6 Terra is used for the comparison eval and harder tasks.

Both purchases are with one vendor (OpenAI); note the API credit is billed separately from the Plus subscription.

You'll also need: a laptop you can bring to every class, a free GitHub account, and a Posit Cloud account (free tier to start; the course provides a shared workspace).

Schedule of Classes

The first meeting of each instructional pair introduces; the second extends and practices. There is no class on September 3. Readings are listed as preparation; the working materials are Quarto documents distributed via the course repository.

Part I: Computing Without a Copilot (August 25–October 27)

Strict no-AI policy in effect — see AI Policy below.

Week 1 (August 25, 27): The Plain-Text Research Life

Why this course exists and why Part I bans AI. Posit Cloud orientation; RStudio and projects; files, folders, and the anatomy of a reproducible pipeline. On Thursday, create a short Quarto paper and presentation, then publish one of them to Posit Connect Cloud.

Read: Healy, *Plain Person's Guide*, chs. 1–2, 4, 7 (skip the Emacs material); Gentzkow & Shapiro, *Code and Data for the Social Sciences: A Practitioner's Guide* (2014), chs. 1–3 — why professionals organize code and data the way this course will make you.

Week 2 (September 1): Git Locally

Version control as the researcher's safety net: repositories, diffs, commits, history, and recovery. We begin with a few terminal commands so the mechanics are visible, then use RStudio's Git controls for ordinary work.

There is no class on Thursday, September 3.

Read: Bryan, *Happy Git*, "Why Git? Why GitHub?" and "Repo, Commit, Diff, Tag."

Week 3 (September 8, 10): GitHub; Importing and Transforming Data

Tuesday connects Git to GitHub and introduces the course pull–commit–push workflow. Thursday begins the tidyverse: importing data, identifying the observational unit, identifiers, and measurements, then using pipes and the core dplyr verbs.

Read: Bryan, *Happy Git*, "Early GitHub Wins"; ModernDive §§1.4 and 3.1–3.4; *R4DS* chs. 1, 3–4 (reference as needed). **Optional practice:** Heiss's interactive primers on tibbles, isolating rows, and deriving variables.

Week 4 (September 15, 17): Summaries, Cleaning, Joins, and Pivots

Tuesday covers grouped summaries, missing values, janitor, skimr, and tidylog. Thursday covers joins with single and composite keys, checks for duplicate and unmatched keys, and pivots.

Read: ModernDive ch. 4. **Optional practice:** Heiss's interactive primer on reshaping data.

Week 5 (September 22, 24): Strings, Dates, Factors, and ggplot2

Tuesday covers the string, date, and factor operations that recur in real projects. Thursday introduces ggplot2's grammar: aesthetics, geoms, layers, groups, positions, and facets.

Read: Healy, *Data Visualization* 2e draft, chs. 3–5. ModernDive ch. 2 and Heiss's visualization primer are optional practice.

Week 6 (September 29; October 1): Publication Graphics; Papers and Bibliographies

Tuesday takes ggplot2 from a working chart to a publication figure using scales, color, themes, labels, annotation, and export. Thursday builds a full academic paper in Quarto with sections, cross-referenced figures and tables, footnotes, and citations, rendered to HTML, PDF, and Word. The bibliography workflow uses BibTeX as plain text, Google Scholar as a citation source, and JabRef to manage a reusable `.bib` file.

Week 7 (October 6, 8): Publishing Yourself; Functions

Tuesday produces two functional drafts, each in a new repository in your own GitHub account. The first is an academic CV based on the course's CV starter, a fork of the `christopherkenny/quarto-cv` template (MIT-licensed; PDF via Typst), driven by YAML and BibTeX data files. The second is a one-page academic website based on the course's minimal Quarto starter, with places for a picture, publications, working papers, and teaching. Publishing the site through GitHub Pages and linking a public CV are optional. Thursday introduces writing reusable functions and control flow.

Week 8 (October 13, 15): Iteration and Text as Data

Tuesday covers vectorization, loops, and iteration with purrr. Thursday treats text as data, using the 60 U.S. presidential inaugural addresses (1789–2025). We read the speeches, count one word over time, and build a keyword list that works as a simple dictionary classifier. Then we seed a keyword-assisted topic model (keyATM) with the same keywords and compare top words and topic shares over time and by party. The lab has you revise one keyword topic. We return to the command line in Part II, when we reach agentic AI.

Week 9 (October 20, 22): APIs

Tuesday introduces APIs through one keyless source, the Federal Register: a request with httr2, a JSON response parsed with jsonlite, and a gentle ramp of nested-JSON wrangling from named lists and lists of records to a tibble. Thursday adds API keys: we store a Congress.gov key safely, pull recent bills into a tibble, and turn them into a simple Quarto dashboard with a headline value, a chart, and a table.

Week 10 (October 27): Midterm, Then the AI Landscape

The class begins with the AI-off Part I midterm practical. Part I ends when it does.

Part II: Computing With AI (October 27–December 3)

AI tools are now required—see the policy below. Part II includes sustained, supervised work with Codex.

After the midterm, we introduce the AI landscape: models versus applications, web chat and agents, API credit versus subscriptions, prompts and training data, local versus cloud models, and the implications for replication and political bias. We'll also go over installation instructions for Posit Assistant and coding-agent harnesses. Problem Set 5, the dashboard you started on October 22, stays AI-off and is due at **10:00 AM November 3**.

No class Thursday, October 29.

Week 11 (November 3, 5): The Controversy; LLMs and Assisted Coding

Tuesday teaches the controversy over AI in research. We read working quantitative social scientists on both sides: the adoption case (Andrew Hall's *Free Systems*; Alexander Kustov's *Popular by Design*), the skeptics' case (peer-reviewed critiques of LLMs in research), and the standard that adjudicates between them, **replication** (King's classic statement; Gentzkow & Shapiro's *Code and Data*). Allowing AI in *research* is separate from allowing it in *training*; Part I's ban was pedagogy, not research ethics. We then cover how LLMs work well enough to know when to distrust them, the three interfaces (chat, IDE

copilots, in-editor tools), prompting patterns, and the verification loop. On Thursday, you meet Posit Assistant, an AI assistant inside RStudio. *Specific readings are listed in the course repository (`Resources/`).*

Week 12 (November 10, 12): Agentic AI with Codex

The first session begins with Posit Assistant, carried over from November 5, and introduces Problem Set 6. It then introduces the Codex terminal workflow, approval modes, and supervised tasks, with git as the safety net. The second covers AGENTS.md project conventions, planning before coding, manageable tasks, reviewing diffs, and checking whether the agent did what it claims.

Week 13 (November 17, 19): Agentic Project Work and Silicon Sampling

Tuesday is a supervised project day: bring a functioning final-project repository and use Codex to build and verify one real piece of the pipeline. Thursday introduces silicon sampling through ellmer and structured output, validated against real CCES respondents using material from Kennedy, Shor, and Austin, *Large Language Models for Public Opinion Research* (Cambridge). The diagnostic repository check is due Thursday; good-faith attempts have through December 1 to correct reproducibility problems found by the check.

Week 14 (November 24, 26): No Class

Thanksgiving week.

Week 15 (December 1, 3): Topic Classification; RAG and Project Work

Tuesday covers topic classification: defining categories, classifying a small set of political texts with a generative model and the specialized Jev decision model, and checking both against human labels. Thursday gives a brief retrieval-augmented generation demonstration, then turns to supervised work on your paper with immediate feedback from Amanda and me. We close with privacy, cost, and reproducibility. Office hours this week and next are project clinics for the paper.

Exam Period: Monday December 14, 2:00–4:00 PM

Two things in the two-hour slot: the **Part II final practical** (about 35–40 minutes, AI required, supervision graded) and five **final presentations** (about 10–12 minutes including Q&A for each student), with a transition and buffer between them. Final paper, repository, dashboard or approved alternative, AI-use statement, and updated CV + website all due the same day.

Class Policies

Course Repositories and Privacy

You'll work in three kinds of repository, split by who owns them and who can see them:

1. **Course materials** (slides, readings, examples, and released lab workbooks) live in a **public** repository — open courseware, like my ICPSR books. Problem-set prompts are released in your private course repository.
2. **Your coursework** — labs, problem sets, and your semester paper — lives in **one private repository I create for you**, owned by the course organization. Only you, Amanda, and I can see it. Your drafts, dead ends, and mistakes are nobody else's business; this repo is your workshop. You begin by committing and pushing directly to `main`. We will add branches and pull requests later.
3. **Your website and CV are yours to keep after the course** (Week 7). Their source may live in private repositories. If you want a public professional site, deploy the website from your personal GitHub account to `username.github.io`; otherwise, render it locally and submit it privately. Posting a public-safe CV is optional. Do not publish a home address, personal phone number, or anything else you do not want indexed.

Setting all this up is the subject of Week 3 (coursework repo) and Week 7 (website + CV); until then, materials will be available on Posit Cloud. You'll need a free GitHub account — create one before the first class (any username you'd be comfortable putting on a CV).

AI-Assisted Grading

I may use AI agents to assist with grading under rubrics I write and supervise. Agents run mechanical checks (does your repo render? do your results reproduce?) and draft rubric-based feedback, and I review every draft before any grade is assigned.

AI Policy

Part I assignments, including Problem Sets 1–5 and the October 27 practical: AI tools are prohibited. No ChatGPT, no Claude, no Copilot, no AI autocomplete, no "just checking one error message." This includes problem sets done at home. Before Part I work begins, disable any generative autocomplete or assistant built into your editor or browser; Amanda or I will help you find the setting. Ordinary non-AI resources—documentation, books, Stack Overflow, package vignettes, and your classmates—are all fair game and encouraged. Amanda and I help during class exercises, but not while a take-home problem set is open.

Part II (beginning right after the midterm on October 27): AI tools are required. Problem Sets 6 and 7 and other Part II work must be done with AI assistance, and the graded artifact is your supervision of it: verification, critique, and correction. You remain fully responsible for everything you submit — "the AI did it" is not a defense; catching what the AI did is the assignment.

Data used with AI tools: work from public, synthetic, or anonymized copies that would be safe to release publicly. Remove names, email addresses, phone numbers, street addresses, respondent contact information, and any key that connects records back to people. Random case ID numbers may remain when the linking key is not included. Check whether combinations such as a rare occupation, precise location, and exact age could still identify someone; coarsen, alter, or replace those fields in the AI-facing copy when needed. Keep the protected original outside any repository or folder an AI tool can access, and document any changes made to the working copy.

Always, in both parts: you must be able to explain any line of code you submit. Problem-set walkthroughs and the practicals give you opportunities to demonstrate this. Inability to explain submitted work may trigger an individual follow-up review and can result in loss of credit when you cannot establish authorship or understanding; it is evidence to investigate, not by itself a finding of academic dishonesty.

Classroom Participation

Don't be afraid of saying something "wrong," and don't be afraid of asking questions — in a five-person skills course, your confusion is almost certainly shared, and surfacing it is a contribution. Amanda and I will both be present at every class, so ask for help as soon as you are stuck.

Laptops and Classroom Etiquette

Keep your laptop on course work during class; texting and social media diminish the learning environment for everyone, and in a room this small, everyone notices. I'll do my best to start and end class on time; please make every effort to do the same.

Office Hours

By Microsoft Teams appointment via Calendly. We can talk about course material, your projects, your experience in the department, or your future plans. In the final weeks, office hours double as project clinics.

Communication

Use Microsoft Teams chat for course questions and messages. I will also post class announcements in Teams, so check the course Team regularly.

Civility

You are free to disagree, even strongly, with each other and with me. However, I expect and demand civility and kindness to each other in class.

Letters of Recommendation

I am happy to write a letter of recommendation for any student who has done well in my course. I need at least three weeks' notice, and it is your responsibility to provide any necessary supporting paperwork.

Excused Absences

Regular class attendance, participation, and engagement in coursework are important contributors to student success. Absences may be excused as provided in the University of Houston Graduate Excused Absence Policy for reasons including: medical illness of student or close relative, death of a close family member, legal or government proceedings that a student is obligated to attend, recognized professional and educational activities where the student is presenting, and University-sponsored activity or athletic competition.

Religious Observance

If you have religious holidays which conflict with the class, this is fine, but send me a Teams chat message ahead of time.

Academic Honesty

All students are expected to adhere to the University of Houston's Policy on Academic Honesty. Cheating and plagiarism in this class will be punished to the maximum extent possible; failure of the course at the very least. This course's AI Policy is part of its academic honesty expectations. See the University of Houston graduate handbook or uh.edu/provost/stu/stu_syllabsuppl.html for the full statement of UH's rules.

Students with Disabilities

Students seeking accommodation in this course should contact the instructor after obtaining the appropriate documentation through the UH Center for Students with Disabilities (713-743-5400). The University of Houston System complies with Section 504 of the Rehabilitation Act of 1973 and the Americans with Disabilities Act of 1990.

Counseling and Psychological Services

Counseling and Psychological Services (CAPS) can help students who are having difficulties managing stress, adjusting to college, or feeling sad and hopeless. You can reach CAPS (www.uh.edu/caps) by calling 713-743-5454.

Recording of Class

Students may not record all or part of class, livestream all or part of class, or make/distribute screen captures, without advanced written consent of the instructor.

Syllabus Updates

I may adjust the schedule as the semester progresses. I will announce changes in Teams and update the posted syllabus and deadline list.
